**Abstract** — Treatment of qinghaosu (1) with acid yielded 1',2',4'-trioxanes (5 and 8), endoperoxides (6 and 9), and diketones (7 and 10). Structures of 5, 6, 7, 8, 9, and 10 were assigned based on their physical and spectral data. Structure-activity correlation among these compounds indicated the steric requirement of the 1',2',4'-trioxane ring system as found in 1 for potent antimalarial activity.

Qinghaosu (artemisinin or arteannuin, 1), a sesquiterpene lactone endoperoxide isolated from the Chinese drug "Qing Hao" (*Artemisia annua* L.),<sup>1,2</sup> has recently been used clinically as a new type of antimalarial agent with rapid action and low toxicity against chloroquine-resistant *Plasmodium falciparum*. In order to investigate the structure-activity relationships, we have previously reported on the synthesis of 1-related compounds, including the 1',2',4'-trioxane lactone (-C-O-O-C-O-C-O-CO-, 2),<sup>3</sup> 1',2',4'-trioxane (-C-O-O-C-O-, 3a and 3b),<sup>3,4</sup> and endoperoxide (-C-O-O-C-, 4)<sup>5</sup> ring systems.

Since these compounds (2, 3a, 3b and 4) were found to be 30~100 times less active than 1 in the *in vitro* antimalarial assay against the chloroquine-resistant *P. falciparum*,<sup>6</sup> it indicates that the antimalarial activity of 1-related analogs may be affected significantly by the steric environment of the 1',2',4'-trioxane ring among these molecules. The ethane bridge between C-1 and C-4 of 1 might play an important role with this respect. We report herein on the synthesis of C-1/C-4 ethane bridge-bearing 1',2',4'-trioxanes (5 and 8), endoperoxides (6 and 9), and diketones (7 and 10) by acidic degradation of 1.

Treatment of 1 with an acid [p-toluenesulfonic acid monohydrate(p-TsOH·H<sub>2</sub>O) or 14% hydrogen chloride (HCl)-MeOH] in anhydrous methyl alcohol (MeOH) gave three products: MT-I (5, 5.5 %),<sup>7</sup> MT-II (6, 20.4 %),<sup>7</sup> and MT-III (7, 3.9 %).<sup>7</sup> These products were purified by silica gel column chromatography.

The <sup>1</sup>H- and <sup>13</sup>C-nmr spectra of MT-I and MT-II were assigned on the basis of <sup>1</sup>H-<sup>1</sup>H COSY and <sup>1</sup>H-<sup>13</sup>C-COSY spectra as well as decoupling experiments between each proton signal. The <sup>1</sup>H- and

$^{13}\text{C}$ -nmr ( $\text{CDCl}_3$ ) and ir (film) spectral data of MT-I {Syrup,  $\text{C}_{17}\text{H}_{28}\text{O}_6$ ,  $[\alpha]_D^{+60^\circ}$  (c 0.7, MeOH)} indicated the presence of one methoxy group [ $^1\text{H}$ -nmr:  $\delta$  3.47 (3H, s);  $^{13}\text{C}$ -nmr:  $\delta$  51.42 (q)] and one carbomethoxy group [ $^1\text{H}$ -nmr:  $\delta$  3.65 (3H, s);  $^{13}\text{C}$ -nmr:  $\delta$  56.00 (q); ir:  $1740\text{ cm}^{-1}$ ], which were absent in 1. The presence of a 1',2',4'-trioxane ring (devoid of the stereochemistry) in MT-I was evidenced by the appearance of the characteristic ion peaks at  $m/z$  328  $[\text{M}]^+$ , 296  $[\text{M}-\text{O}_2]^+$ , 238  $[\text{296-Me}_2\text{CO}]^+$ , and 207  $[\text{238-MeO}]^+$  in its ms spectrum, together with the  $^{13}\text{C}$ -nmr ( $\text{CDCl}_3$ ) peaks at  $\delta$  55.32(d, C-1), 24.45(t, C-2), 37.44(t, C-3), 105.07(s, C-4), 99.11(d, C-5), and 86.84(s, C-6)].

The assignment of the conformation of 1',2',4'-trioxane ring skeleton of MT-I as depicted in 5 was based on a comparison of its  $^1\text{H}$ -nmr spectrum with that of 1. Compound 1 displayed proton signals at  $\delta$  2.43(ddd,  $\text{H}\alpha$ -3), 2.06(ddd,  $\text{H}\beta$ -3), 1.50(dddd,  $\text{H}\beta$ -2), 2.01(m,  $\text{H}\alpha$ -2), and 1.43(m,  $\text{H}\beta$ -10) with  $J_{1,10}=J_{1,2\beta}=11.5\text{ Hz}$ ,  $J_{1,2\alpha}=6.7\text{ Hz}$ ,  $J_{2\alpha,3\alpha}=3.9\text{ Hz}$ ,  $J_{2\alpha,3\beta}=4.4\text{ Hz}$ ,  $J_{2\beta,3\alpha}=13.0\text{ Hz}$ , and  $J_{2\beta,3\beta}=3.2\text{ Hz}$ , whereas MT-I showed proton peaks at  $\delta$  1.20(ddt,  $\text{H}\alpha$ -1), 1.72(m,  $\text{H}\alpha$ -2), 1.79(m,  $\text{H}\beta$ -2), 2.31(ddd,  $\text{H}\alpha$ -3), 2.02(ddd,  $\text{H}\beta$ -3), 5.30(d,  $\text{H}\alpha$ -5), 1.93(m,  $\text{H}\beta$ -10), and 2.86(dq, H-11) with nearly identical coupling constants of  $J_{1,10}=J_{1,2\beta}=11.5\text{ Hz}$ ,  $J_{1,2\alpha}=6.7\text{ Hz}$ ,  $J_{1,5\alpha}=1.6\text{ Hz}$  (W-type long-range coupling between H-1 and  $\text{H}\alpha$ -5),  $J_{2\alpha,3\alpha}=4.1\text{ Hz}$ ,  $J_{2\alpha,3\beta}=4.5\text{ Hz}$ ,  $J_{2\beta,3\alpha}=12.9\text{ Hz}$ , and  $J_{2\beta,3\beta}=3.3\text{ Hz}$ . A significant deshielding effect was also observed. This included a downfield shift of 0.29, 0.37, 0.29, and 0.50 ppm when compared the chemical shifts of  $\text{H}\alpha$ -3 and  $\text{H}\beta$ -3 of MT-I,  $\text{H}\alpha$ -3 and  $\text{H}\beta$ -3 of 1,  $\text{H}\beta$ -2 of 1 and  $\text{H}\beta$ -2 of MT-I, and  $\text{H}\beta$ -10 of 1 and  $\text{H}\beta$ -10 of MT-I, respectively. The above evidence led to the assignment of MT-I as 5, in which it possesses a 1',2',4'-trioxane ring nearly identical sterically to that of 1.

The  $^1\text{H}$ - and  $^{13}\text{C}$ -nmr spectral data ( $\text{CDCl}_3$ ) of MT-II {oil,  $\text{C}_{17}\text{H}_{28}\text{O}_6$ ,  $[\alpha]_D^{+152.6^\circ}$  (c 0.9, MeOH)} indicated the presence of one methoxy [ $^1\text{H}$ -nmr:  $\delta$  3.36(3H, s);  $^{13}\text{C}$ -nmr:  $\delta$  49.13(q)], one carbomethoxy [ $^1\text{H}$ -nmr:  $\delta$  3.65(3H, s);  $^{13}\text{C}$ -nmr:  $\delta$  51.42(q)], and one formyl [ $^1\text{H}$ -nmr:  $\delta$  9.93(1H, d,  $J=2.8\text{ Hz}$ );  $^{13}\text{C}$ -nmr:  $\delta$  200.75(d)] groups as new signals, which were not seen in 1. The presence of an endoperoxide group (devoid of the stereochemistry) in MT-II was substantiated by the characteristic ms spectral ion peaks at  $m/z$  328  $[\text{M}]^+$ , 296  $[\text{M}-\text{O}_2]^+$ , 265  $[\text{296-MeOH}]^+$ , 236  $[\text{265-CHO}]^+$ , and 177  $[\text{236-COOMe}]^+$  as well as by the  $^{13}\text{C}$ -nmr signals at  $\delta$  59.49(d, C-1), 22.11(t, C-2), 40.60(t, C-3), 94.12(s, C-4), 200.75(d, C-5), and 108.51(s, C-6). The relative configuration at H-1 [ $\delta$  1.16(m)], Me-4 [ $\delta$  1.19(s)], CHO-6 [ $\delta$  9.93(d)], and H-10 [ $\delta$  2.23(m)] in MT-II was deduced as  $\alpha$ ,  $\beta$ ,  $\beta$ , and  $\beta$ , respectively, by their  $^1\text{H}$ -nmr coupling patterns [ $J_{1,10}=12.0\text{ Hz}$ ,  $J_{1,2\beta}=11.5\text{ Hz}$ ,  $J_{1,2\alpha}<1.0\text{ Hz}$ ,  $J_{1,5}=2.7\text{ Hz}$  (W rule signals between H-1 and H-5),  $J_{2\alpha,2\beta}=14.9\text{ Hz}$ ,  $J_{2\alpha,3\alpha}<1.0\text{ Hz}$ ,  $J_{2\alpha,3\beta}=7.1\text{ Hz}$ ,  $J_{2\beta,3\alpha}=11.5\text{ Hz}$ ,  $J_{2\beta,3\beta}<1.0\text{ Hz}$ , and  $J_{3\alpha,3\beta}=14.5\text{ Hz}$ ], and by use of NOESY technique, which confirmed the interactions between  $\text{H}\beta$ -3 [ $\delta$  2.05(ddd)] and Me-4 [ $\delta$  1.19(s)]; H-1 [ $\delta$  1.16(m)] and  $\text{H}\alpha$ -3 [ $\delta$  1.94(ddd)]; H-1,  $\text{H}\alpha$ -9 [ $\delta$  0.94(m)], and  $\text{H}\alpha$ -7 [ $\delta$  1.52(ddd)];  $\text{H}\alpha$ -2 [ $\delta$  1.79(ddt)] and Me-10 [ $\delta$  0.89(d)]; and  $\text{H}\beta$ -2 [ $\delta$  1.38(ddt)] and Me-4 [ $\delta$  1.19(s)]. The strong shielding effect by an upfield shift of 0.41 ppm when compared the chemical shifts of  $\text{H}\beta$ -2 in MT-II and  $\text{H}\beta$ -2 in MT-I, plus the deshielding

downfield shifts by 0.30 and 0.33 ppm of H $\beta$ -10 and H-11[  $\delta$  3.19(dq)] when compared to their corresponding protons in MT-II and MT-I, respectively, led to the assignment of the stereochemistries of C-4, C-6, and C-11 of MT-II as shown in 6. The stereostructure of MT-II was thus established as 6.

The stereostructure of MT-III was determined to be 7 on the basis of its ms and  $^1\text{H}$ -nmr spectral characteristics.<sup>9</sup>

Treatment of 1 with an acid [p-TsOH $\cdot$ H $_2$ O or 14 % HCl-ethyl alcohol(EtOH)] in anhydrous EtOH gave rise to ET-I (8, 9.9 %),<sup>10</sup> ET-II (9, 38.0 %),<sup>10</sup> and MT-III (10, 3.5 %)<sup>10</sup> after purification by silica gel column chromatography.

The stereostructures of ET-I, -II and -III were established as 1',2',4'-trioxane (8), endoperoxide (9), and diketone (10), respectively, on the basis of  $^1\text{H}$ - and  $^{13}\text{C}$ -nmr (utilization of  $^1\text{H}$ - $^1\text{H}$ -COSY,  $^1\text{H}$ - $^{13}\text{C}$ -COSY, and NOESY techniques) and ms spectral data<sup>11</sup> as described in the structural elucidation of MT-I, -II, and -III.

The formational mechanism of compounds (5~10) from 1 by acid-ROH(R=Me, Et) can be considered as shown in Scheme.

Scheme

The 1',2',4'-trioxanes (5 and 8) were found to be almost equipotent active with 1 in the *in vitro* antimalarial assay against the chloroquine-resistant *P. falciparum*.<sup>6</sup> On the other hand, the endoperoxides (6 and 9) did not show noteworthy activity (about 100 times less active than 1).<sup>6</sup> These results clearly indicate that the steric environment of the 1',2',4'-trioxane ring system as

found in 1, 5, and 8 is vital for expressing antimalarial activity. Further investigation along this line is currently in progress.

#### ACKNOWLEDGEMENT

The authors are grateful to Dr. Ai Jeng Lin of Walter Army Institute of Research for his interest and assistance in this research.

4. Compound 3b showed  $^1\text{H}$ -nmr(400 MHz,  $\text{CDCl}_3$ ) signals at  $\delta$  0.88(3H, d,  $J=6.6$  Hz, Me-5), 0.95(1H, dt,  $J=1.5, 13.0$  Hz,  $\text{H}\alpha$ -6), 1.21(3H, d,  $J=7.3$  Hz, Me-7), 1.35(3H, d,  $J=5.4$  Hz, Me-9), 1.93(1H, m, H-5), 2.82(1H, dq,  $J=3.0, 7.3$  Hz, H-7), 2.76(1H, ddd,  $J=1.5, 4.0, 13.0$  Hz,  $\text{H}\beta$ -6), 3.48(3H, s, MeO-8), 3.68(3H, s, MeOOC-9), 5.04(1H, d,  $J=1.5$  Hz, H-8), and 5.40(1H, q,  $J=5.4$  Hz, H-7). We have previously<sup>3</sup> reported the synthesis of 3a and 3c. However, the stereo-structure assigned for 3c previously must be revised to 3b, as irradiation of H-8 at  $\delta$  5.04 increased the intensity (a positive nOe effect) of H-7 at  $\delta$  5.40. Furthermore, the presence of a W-type long range coupling ( $J=1.5$  Hz) between H-8 and  $\text{H}\alpha$ -6 was also observed. This work was presented at the 27th Chugoku Shikoku Branch Annual Meeting of Pharmaceutical Society of Japan, Shimane, 1988, Abstracts of paper, p. 40.
