Abstract-An efficient chiral synthesis of both diastereoisomers (2a) and (2b) was performed using *trans*-4-hydroxy-L-proline as starting material. These bridged piperazines were used in the preparation of quinolones.

In the course of our investigations on the synthesis of new quinolones, BMY 40062¹ (1) (Figure 1) was found to be a potent antibacterial agent. The chiral (1R,4R)- or (1S,4S)-2,5-diazabicyclo[2.2.1]heptane groups have already been used as the C₇-substituent of other antimicrobial quinolones.^{2,3} To extend our work in this area, we were interested in modifying the naphthyridine (1) by adding a methyl group on the chiral bridged piperazine (2).

We started from the *trans*-4-hydroxy-L-proline (3) (Scheme 1), which after inversion at C₂, *N,O*-ditosylation and inversion at C₄, provided the 4-acetoxy-*N*-tosyl-D-proline ethyl ester (5) in 29% yield (from 3) as previously

Figure 1

described.¹

Methanolysis of the 4-acetoxy group of **5**, protection of the free hydroxy function with a *tert*-butyldimethylsilyl group and finally alkaline hydrolysis of the ethyl ester, gave the acid (**6**)⁴ in 82% yield from **5**. Amidation of **6** with 3,5-dimethylpyrazole and DCCI, performed in 98% yield, was followed by reduction with LiAlH_4 ⁵ at -40°C leading to the aldehyde (**7**)⁶ (71%). Reaction of **7** with MeMgBr gave a mixture of the diols (**8a**)⁷ and (**8b**)⁸ in 91% yield (these two diastereoisomers could be separated by chromatography on silica gel at this step). The mixture of diols was deprotected with 3.3 % conc. HCl in EtOH (87%), ditosylated with *p*-toluenesulfonyl chloride (96.4%) and finally cyclized with benzylamine in refluxing toluene for 48 h to yield a mixture (~50/50 ratio) of the expected bridged piperazines (**2a**)⁹ and (**2b**)¹⁰ which were easily separated by column chromatography on silica gel (62% total yield for both isomers).

Each bridged piperazine (**2a**) or (**2b**) was detosylated with 33% HBr in AcOH at 80°C and the resulting dihydrobromide salts (**10a**) or (**10b**)¹¹ were condensed with ethyl 7-chloro-1,8-naphthyridine-3-carboxylate (**11**) to provide **12a** or **12b** (Scheme 2). Debenzylation followed by hydrolysis of the ethyl

a) $\text{Ac}_2\text{O}, \text{AcOH}$; b) EtOH, HCl ; c) $\text{TsCl}, \text{NEt}_3, \text{pyridine}$; d) $\text{NEt}_4^+ \text{AcO}^-$; e) $\text{Na}_2\text{CO}_3, \text{MeOH}$, 87%; f) $\text{ImH}, \text{ClTBDS}, \text{DMF}$, 98%; g) KOH, EtOH , 96%; h) 3,5-Dimethylpyrazole, DCCI, CHCl_3 , 98%; i) $\text{LiAlH}_4, \text{THF}$, 71%; j) $\text{MeMgBr}, \text{Et}_2\text{O}$, 91%; k) 3.3% conc. HCl, EtOH , 87%; l) $\text{TsCl}, \text{pyridine}$, 97%; m) $\text{BnNH}_2, \text{toluene}$, 62%.

Scheme 1

esters (12) led to 13a or 13b.¹² The isomer (13b) showed a two-fold better *in vitro* antibacterial activity than 13a.

a) 33% HBr, AcOH, 70-90%; b) DBU, MeCN, 62-85%; c) H₂, 10% Pd/C, 1N HCl, MeOH, 80-99%;
 d) 1N NaOH or 1N HCl, EtOH, 63-75%.
