Abstract — An enantiocontrolled route to the common C₁₁₋₁₇ segment (2) of mycinamicins III (1a) and IV (1b) has been developed starting from the chiral α -hydroxyacetylene (6) obtained from (*E*)-4-benzyloxybut-2-en-1-ol (3).

In connection with a formal synthesis of protomycinolide IV,¹ we report here an enantiocontrolled route to the common C₁₁₋₁₇ segment (2) of the macrolide antibiotics mycinamicins² III (1a) and IV (1b) starting with the chiral α -hydroxyacetylene^{3,4} (6) obtained from 4-benzyloxybut-2-en-1-ol (3) by the Katsuki-Sharpless asymmetric epoxidation reaction followed by the base induced double elimination reaction *via* the epoxide intermediates (4) and (5).

Figure 1

The acetylene alcohol^{3,4} (**6**) was first converted into the one-carbon elongated (*Z*)-olefin alcohol (**11**) in a standard sequence of reactions *via* the silyl ether intermediates (**7**)~(**10**) without difficulties. This was then transformed into the propargyl ether (**13**) in 2 steps employing a modified Williamson synthesis using a complex of potassium fluoride and neutral alumina as catalyst^{1,5} followed by silylation of the terminal acetylene group. The base induced [2,3]-Wittig rearrangement^{1,6,7} of **13** proceeded in a complete diastereoselective manner to furnish a single product (**15**) having (*R,R*)-configuration in an excellent yield which may be generated *via* a 'folded envelope' transition state⁶ (**14**). Optical purity of the product was determined to be $\geq 95\%$ ee by ¹H nmr spectra (500 MHz) of the MTPA (*R*- and *S*-) esters. After desilylation of **15**, the configuration of the secondary hydroxy carbon center of the resulting **16** was inverted by employing the Mitsunobu reaction⁸ to give the eneynol (**18**) having natural (*14R,15S*)-configuration after methanolysis of the resulting benzoate (**17**).

In order to discriminate the two unsaturated bonds, the eneynol (**18**) was first treated with *N*-bromosuccinimide (NBS) to protect the olefinic bond selectively by the formation of the bromo ether (**19**) as a mixture of epimers. The acetylenic group of the mixture was then hydrogenated to give the saturated ether (**20**) as a mixture of epimers. This was next exposed to zinc dust in the presence of hydrochloric acid to regenerate the olefinic bond to give rise to the benzyl ether (**21**) of the C₁₁₋₁₇ segment (**2**) with concomitant removal of the methoxymethyl group under the conditions.

To confirm the structure of **21**, it was transformed into the acetonide (**22**) whose benzyl group was then replaced by 2-trimethylsilylethoxymethyl (SEM) group⁹ in two steps to give the SEM ether (**24**) *via* the primary alcohol (**23**). Finally, removal of the acetonide group from **24** afforded the SEM ether (**25**) of the C₁₁₋₁₇ segment (**2**) which has already been obtained by an entirely different procedure in the total synthesis of mycinolide IV, the aglycon of mycinamicins III (**1a**) and IV (**1b**), by Suzuki, Tsuchihashi and coworkers.^{10,11}

EXPERIMENTAL SECTION

Optical rotations were measured with a JASCO-DIP-370 digital polarimeter. Ir spectra were measured with a JASCO-IR-700 spectrophotometer. ^1H Nmr spectra were recorded on JEOL-JNM-FX90A (90 MHz) and JEOL-JNM-GX500 (500 MHz) spectrometers. Mass spectra were measured with a JEOL JMS-DX303 instrument. Reactions were carried out under argon.

(4R,5R)-(E)-1-Benzylxy-5-hydroxy-4-hydroxymethylhept-2-ene

(21) [the Monobenzyl Ether of the C_{11-17} Segment (2)] — A suspension of the bromo ether (20) (383.0 mg, 1.03 mmol) and zinc dust (671.2 mg, 10.3 mmol) in MeOH (5 ml) containing 35% hydrochloric acid (0.1 ml) was refluxed for 2.5 h. After filtration, the filtrate was evaporated under reduced pressure and the residue was taken up into Et_2O . The ethereal layer, after filtration using Celite pad, was washed with saturated aqueous $NaHCO_3$, brine, dried over $MgSO_4$, and evaporated reduced pressure. The residue was purified on a silica gel column (10 g) to give the diol (21) (194.0 mg, 76%) as a colorless oil; $[\alpha]_D^{27} -8.65^\circ$ (c 1.00, $CHCl_3$). Ir (film) ν_{max} : 3380 cm^{-1} ; 1H nmr ($CDCl_3$) δ : 7.33 (s, 5H), 5.87-5.63 (m, 2H), 4.52 (s, 2H), 4.11-3.95 (m, 2H), 3.77 (d, $J=5.6$ Hz, 2H), 3.70 (m, 1H), 2.55-1.85 (m, 3H, 2H exchangeable with D_2O), 1.78-1.22 (m, 2H), 0.94 (t, $J=7.8$ Hz, 3H); ms (m/z): 174 ($M^+-C_3H_8O_2$), 91 (100%).
