Abstract — Three aromatic alkaloids, eupomatidines-1 (**1a**), 2 (**1b**) and 3 (**1c**), were synthesized from the corresponding 1,4-naphthoquinones (**2a, b**) by hetero Diels-Alder reaction with 2-butenal dimethylhydrazones (**3a, b**), followed by one pot annelation of ring A.

In 1991, three aromatic alkaloids, eupomatidines-1 (**1a**), 2 (**1b**), and 3 (**1c**) were isolated from the archaic monogeneric angiosperm family Eupomatiaceae, *Eupomatia bennettii* and *E. laurina*.¹ The structures of eupomatidines-1, 2, and 3 were elucidated by ir, uv, ms and ¹H-nmr spectra as 9-methoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(*7H*)-one (**1a**), 4-methoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(*7H*)-one (**1b**), and 4,9-dimethoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(*7H*)-one (**1c**), respectively.¹ We report here the first total synthesis of eupomatidines-1 (**1a**), 2 (**1b**), and 3 (**1c**).

Eupomatidine-1 (**1a**): R₁ = H, R₂ = OCH₃Eupomatidine-2 (**1b**): R₁ = OCH₃, R₂ = HEupomatidine-3 (**1c**): R₁ = R₂ = OCH₃

The hetero Diels-Alder cycloaddition² of 6-methoxy-1,4-naphthoquinone³ (**2b**) with 2-butenal dimethylhydrazone⁴ (**3a**) in acetonitrile (80°C, 4 h) afforded the corresponding adducts (**4a** and **5a**) as a 3:1 mixture in 48% yield. Oxidation of **4a** by manganese dioxide² in chloroform gave 8-methoxy-4-methylbenzo[*g*]quinoline-5,10-dione⁵ (**6a**) in 74% yield. The aza-anthraquinone (**6a**) was condensed with dimethylformamide diethylacetal⁶ in dimethylformamide to give the enamine (**7a**). Treatment of the crude

enamine (7a) with ammonium chloride in refluxing acetic acid⁶ afforded the desired 9-methoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(7*H*)-one (1a), *i.e.* eupomatidine-1,⁷ in 93% yield from 6a.

Next, we synthesized eupomatidine-2 (1b). The hetero Diels-Alder cycloaddition of 1,4-naphthoquinone (2a) with 2-methoxy-2-butenal dimethylhydrazone⁸ (3b) was carried out in chloroform⁹ at 20°C (2 h) to give the corresponding adduct (4b)¹⁰ in 79% yield. The adduct (4b) was converted to 4-methoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(7*H*)-one¹¹ (1b), *i.e.* eupomatidine-2, via 6b¹² as above in 66% yield from 4b.

Finally, eupomatidine-3 (1c) was prepared. The cycloaddition of 6-methoxy-1,4-naphthoquinone (2b) with 2-methoxy-2-butenal dimethylhydrazone (3b) in chloroform at 20°C (2 h) afforded the corresponding adducts (4c; 57% yield and 5b; 13% yield). We have found that aza-diene (3b) reacts faster than 3a and under milder conditions towards 6-methoxy-1,4-naphthoquinone (2b). The adduct (4c) was converted to 4,9-dimethoxynaphtho[1,2,3-*ij*][2,7]naphthyridin-7(7*H*)-one¹³ (1c), *i.e.* eupomatidine-3, via 6c¹⁴ as above in 42% yield from 4c.

The spectroscopic data obtained for 1a-c were identical to the values reported for the corresponding natural products, eupomatidines-1, 2, and 3 by Carroll and Taylor.¹

Reagents and Conditions: a) CH₃CN, 80°C, 4 h, or CHCl₃, 20°C, 2 h.

b) MnO₂ (large excess), CHCl₃, 20°C, 1 h.

c) (C₂H₅O)₂CH-N(CH₃)₂, DMF, 120°C, 30 min.

d) NH₄Cl, CH₃CO₂H, reflux, 30 min.

ACKNOWLEDGEMENT
