Abstract- The reaction of 4-chloro-3-ethynyl-6-methyl-2*H*-pyran-2-one (**2**) with aniline derivatives having a electron-donating group at the 3-position in EtOH gives 7-substituted 1*H*-pyrano[4,3-*b*]quinolin-1-one derivatives (**3**).

It has been reported that 4-chloro-3-(1-chlorovinyl)-6-methyl-2*H*-pyran-2-one (**1**) reacts with appropriate nucleophiles to give various heterocyclic compounds containing pyrone ring such as aminopyrone,¹ pyranopyrazole,² pyranobenzodiazepine,³ and pyranoquinoline.³

In the preceding paper,³ we have shown that 4-chloro-3-ethynyl-6-methyl-2*H*-pyran-2-one (**2**) formed by the reaction of **1** with a base is an active intermediate in these reactions, and that only the reaction of **1** and **2** with *m*-phenylenediamine gave a 1*H*-pyrano[4,3-*b*]quinoline (**3**) but such ring formation was not noticed with *o*- and *p*-analogs. These results apparently indicate that the electron-donating character of the 3-amino substituent is essential for the formation of the pyranoquinoline ring system. In order to explore this aspect we examined the reaction of **2** with various substituted anilines.

A mixture of **2** and 2.1 molar eq. amount of *m*-anisidine in EtOH was heated under reflux for 4 h to give the pyranoquinoline (**3a**) in 80 % and the acetylpyrone (**4a**) in 5 % yield. However, on addition of Et₃N as a scavenger of hydrogen chloride in this reaction, the yield of **3a** markedly decrease (2.7 %) and Schiff base of **4a** (**5a**) was formed as the main product. Treatment of the Schiff base (**5a**) with dil. HCl gave the acetylpyrone (**4a**) in 85 % yield. ¹H-Nmr spectra of the pyranoquinoline (**3a**) showed three typical signals of a *meta*-coupled proton at 7.25 ppm, an *ortho*- and *meta*-coupled proton at 7.16 ppm, and an *ortho*-coupled proton at 8.06 ppm. Furthermore, the

irradiation of methyl proton at 3.16 ppm of **3a** gives NOE (3%) on an *ortho*-coupled proton at 8.06 ppm. These data are well consistent with the structure of **3a** as 7-methoxy-3,10-dimethyl-1*H*-pyrano[4,3-*b*]quinolin-1-one.

Scheme 2

On the other hand, the reaction of **2** with 2.1 molar eq. amount of *o*- or *p*-anisidine, respectively, in the absence of Et₃N gave acetylpyrones (**4b,c**); the corresponding pyranoquinolines were not obtained. These reactions in the presence of Et₃N gave Schiff bases (**5b,c**), which gave acetylpyrones (**4b,c**) upon treatment with dil. HCl. The acetylpyrone (**4c**) was also obtained by hydrolyzing the 3-ethynylpyrone (**6**) which was prepared from the reaction of **2** with *p*-anisidine at room temperature. Treatment of **2** with anilines having an electron-donating group, such as NMe₂, NH₂, and OH, at the 3-position under the first mentioned conditions afforded pyranoquinolines (**3b-d**) in good yields. However, reactions of **2** with 3-ethylaniline, 3-halogenoanilines, and aniline gave only the corresponding acetylpyrones (**4d-i**). The structures of all products were determined by the spectral and analytical evidence.

Scheme 3

A probable route of the ring formation of pyranoquinoline by the reaction of **2** with aniline derivatives may be postulated as shown in Scheme 4. Thus, **2** reacts with anilines to give first 4-anilino-3-ethynylpyrone (**6'**); **6** was successfully isolated from the reaction of **2** with *p*-anisidine at room temperature. If a substituent at the 3-position of aniline has strong electron-donating effect, the ring formation occurs at the 6-position of the aniline to give pyranoquinoline (**3**). However, if it has little or no such effect, **6'** was hydrolyzed to give acetylpyrones (**4**). Under basic conditions, **6'** preferentially reacts with excess anilines to give Schiff bases (**5**).

EXPERIMENTAL

All melting points are uncorrected. Ir spectra were taken with Hitachi Model 260-10 spectrophotometer. Ms spectra were measured on JEOL JMS-DX303/LMA-DA5000 instrument. ¹H-Nmr spectra were recorded on JEOL JNM-GSX400 and JNM-PMX60S₁ spectrometers. Chemical shifts are reported in parts per million (δ) downfield from tetramethylsilane as an internal standard.

Reaction of 2 with anilines ; General procedure : A mixture of **2** (1 g, 5.9 mmol) and anilines (12 mmol) in EtOH (70 ml) was heated under reflux for 4 h. The precipitate was collected by filtration, washed with water, and then recrystallized. The filtrate was concentrated, and the residue was diluted with CHCl₃ (60 ml). The solution was washed with water and dried over anhydrous Na₂SO₄. The solvent was removed *in vacuo*, and the residue was purified by column chromatography on silica gel with CHCl₃.
