Rama VI Road, Bangkok 4, Thailand

Compound (II), obtained from synthesis, was found to be identical with the product from the reaction of papaverinol with 90% sulphuric acid. 89% Orthophosphoric acid was found to be the acid of choice for the selective demethylation of papaverinol.

Structure (I) was assigned to a monodemethylation product obtained from the reaction of papaverinol with 90% sulphuric acid¹. We have recently synthesized various 1-isoquinolyl-phenylcarbinol derivatives², and from this synthetic study, the structure of the monodemethylation product should be revised to its isomeric structure³ (II).

I R = H, R₁ = Me

II R = Me, R₁ = H

Papaverinol R = R₁ = Me

Reissert compound (III) was synthesized by the new procedure⁴. Reaction of 6,7-dimethoxyisoquinoline with trimethylsilyl cyanide, benzoyl chloride in methylene chloride and a catalytic amount of aluminium chloride gave the Reissert compound (III) in 75% isolated yield, mp 159-160°. The carbanion was generated from compound (III) by the action of 50% sodium hydroxide and benzyltrimethylammonium chloride. Reaction of the derived carbanion with O-benzylvanillin gave first compound (IV) which was not isolated but hydrolysed further with ethanolic sodium hydroxide to give compound (V) in 63% yield. Compound (V) has the following physical data: mp 143.5-144°; ir 3275 cm⁻¹; nmr (CDCl₃) δ 3.78 (s, 2xOCH₃), 4.00 (s, OCH₃) 5.13 (s, -CH₂O), 6.18 (s, HC-OH), 6.88 (s, C-2', C-5', C-6' ArH), 7.13, 7.16 (2s, C-5, C-8 ArH), 7.38 (s, C₆H₅), 7.57 (d, J = 6Hz, C-4 HC=), 8.30 (d, J = 6Hz, C-3 CH-N). Debenzylation of compound (V) with 89% orthophosphoric acid (vide infra) gave compound (II) which was shown to be identical (mp, ir, nmr, and tlc) with the product obtained from the reaction of papaverinol with 90% sulphuric acid.

III

We have investigated the reaction of various acids with papaverinol and found that selective demethylation was best achieved with 89% orthophosphoric acid. When a solution of papaverinol in 89% orthophosphoric acid was heated at 37-40° (oil bath temperature) for 48 hr., compound (II) was isolated in 67% yield together with some unreacted papaverinol. Compound (V) could be debenzylated with 89% orthophosphoric acid at room temperature (48 hr.) in 61% yield.
