

APPLICATION OF 3-(O-SUBSTITUTED ANILINO)-2-CYCLOHEXEN-1-ONES IN THE SYNTHESIS
OF NEW HETEROCYCLIC RING SYSTEMS

The synthetic routes leading to new heterocyclic ring systems have been investigated, starting with enamino-ketones (3) which are readily available from the condensation of cyclohexan-1,3-diones (1) with o-substituted anilines (2).

As a result, the enamino-ketones; 3-(o-substituted anilino)-2-cyclohexen-1-ones (3) was proved to be quite convenient starting materials to the synthesis of 4, 5, or 6 which had been much less accessible according to the known preparative methods. It has also been observed that on heating under acidic media enamino-ketones, 3a, 3c, and 3d underwent ring-cleavage reaction and finally gave rise to the compounds which is represented as a general formula 7.
