Abstract ---- o-Phenylenediamines and 1,2-diamines reacted with dimethyl acetylenedicarboxylate (DMAD) to afford trimethyl 3-oxo-1,2,3,4-tetrahydroquinoxaline- $\Delta^{2,\gamma}$ -aconitates and trimethyl 3-oxo-piperazine- $\Delta^{2,\gamma}$ -aconitates which were converted to pyrido[1,2-a]quinoxalines and pyrido[1,2-a]pyrazines, respectively, by thermal or photochemical reactions.

Acetylenic esters are widely used for the preparation of heterocyclic compounds.²⁾ As a part of our studies on heterocyclic compounds, we recently reported the results of the reactions of benzazoles³⁾ or nucleic acid bases⁴⁾ with dimethyl acetylenedicarboxylate (DMAD). In this paper, we describe a novel synthesis of pyrido[1,2-a]quinoxalines and pyrido[1,2-a]pyrazines. The reaction of o-phenylenediamine (Ia) with DMAD in MeOH has been known to produce 3-methoxycarbonylmethylene-2-oxo-1,2,3,4-tetrahydroquinoxaline (IIIa).⁵⁾ The further reaction of IIIa (3.0g) with DMAD (5ml) in dioxane (30ml) under reflux overnight provided a crystalline solid which was collected by filtration and recrystallized from CH₂Cl₂-EtOH to afford trimethyl 3-oxo-1,2,3,4-tetrahydroquinoxaline- $\Delta^{2,\gamma}$ -aconitate (Va, 1.54g).⁶⁾ From the filtrate, additional Va (1.25g) was isolated by column chromatography on silica gel (total 2.79g, 54.44%).

The compound Va was also obtained directly by the reaction of o-phenylenediamine (Ia, 1.08g) with DMAD (5ml) in refluxing dioxane (30ml) overnight. Evaporation of the reaction mixture afforded crystals, which were collected, washed with EtOH and recrystallized from CH₂Cl₂-EtOH to give Va (1.39g). From the filtrate and washings, additional Va (0.29g) was obtained by preparative TLC on silica gel with benzene-ethyl acetate (4 : 1) as developer (total 1.68g, 46.7%).

scheme 1

Table 1 The products obtained from the reactions of III and IV with DMAD

Compound	mp (°C)	MS $\frac{m}{e}(M^+)$	yield(%)
V a $R_1 = R_2 = H$	220-221	360	56.4
b $R_1 = H, R_2 = Cl$	170-172	394, 396	20.0
VI a $R_1 = Me, R_2 = H$	181-182.5	326	53.1
b $R_1, R_2 = -(CH_2)_4-$	145-147	366	47.7

The structure of Va was assumed by the satisfactory elemental analysis, spectral data and comparison with X-ray analysis of a similar compound.⁶⁾ Other compounds (Vb, VIa and VIb) were prepared in a similar manner and their melting points and yields are shown in Table 1.⁶⁾

A solution of Va (3.0g) in dry DMSO (70ml) was refluxed for 1 h under nitrogen to give an almost single product on TLC. Extraction of the reaction product with ethyl acetate followed by evaporation of the solvent provided a brownish crystalline solid (1.75g, 63.9%) which was recrystallized from CH_2Cl_2 -MeOH to afford yellow needles; dimethyl 5,6-dihydro-6,10-dioxo-10H-pyrido[1,2-a]-quinoxaline-7,8-dicarboxylate [VIIa, mp 282-284°, $C_{16}H_{12}N_2O_6$, m/e 328(M^+); ν_{max}^{KBr} (cm^{-1}) 1735, 1710, 1650, 1585; 1H -nmr (DMSO- d_6) δ (ppm) 3.76, 3.85 (each s, 3H, OMe X 2), 7.27 (s, 1H, vinylic), 7.05-7.50 (m, 3H, aromatic), 9.11 (d, $J = 8Hz$, 1H, aromatic), 12.02 (broad, 1H, NH); ^{13}C -nmr (DMSO- d_6) δ (ppm) 52.14, 53.12, 95.46, 116.02, 120.90, 122.26, 122.85, 125.77, 128.11, 128.31, 133.42, 136.78, 154.45, 160.51, 163.34 and 165.49]. This product was also prepared by treatment with Et_3N of Va in EtOH as shown in Table 2. Furthermore, we could obtain VIIa by photolysis

scheme 2

of Va in acetone in low yield.⁷⁾ Similar thermal reactions of V and VI afforded VII and dimethyl 1,6-dioxo-1,2,3,4-tetrahydro-6H-pyrido[1,2-a]pyrazine-8,9-dicarboxylates (VIII), respectively, in each yields shown in Table 2.⁸⁾

The spectral data described above suggest that this pyrolysis resulted in the elimination of MeOH from Va and hence an intramolecular cyclization was caused to form VIIa or VIIa'. In ¹H-nmr spectrum of VIIa, one of the aromatic protons (δ 9.11) is observed at a very low magnetic field. The low field resonances of aromatic protons (δ 8.58, 8.73 and 8.80) in the same solvent have been reported in analogous tricyclic compounds (VIIa'').⁹⁾ The extent of down field shift in VIIa'' is a little smaller than that in our compound. Studies with molecular models show that this paramagnetic shift is due to the close proximity between C₁₀ (or C₉) carbonyl group and C₁ aromatic proton and that more downfield shift is expected for VIIa in contrast with VIIa' because the C₁ proton of VIIa lies in closer to the carbonyl group compared with that of VIIa'. Thus, the structure of this cyclized compound is assigned as dimethyl 5,6-dihydro-6,10-dioxo-10H-pyrido[1,2-a]quinoxaline-7,8-dicarboxylate (VIIa).

scheme 3

Table 2 The cyclization products

Compound	mp(°C)	MS $\frac{m}{e}$ (M ⁺)	yield(%)
VII a R ₁ = R ₂ = H	282-284	328	63.9(22.0 [*])
b R ₁ = H, R ₂ = Cl	295-296	362,364	51.7
VIII a R ₁ = Me, R ₂ = H	202.5-203.5	294	79.7
b R ₁ , R ₂ = -(CH ₂) ₄ -	243-245	334	66.2(50.3 [*])

* treatment with Et₃N

In conclusion, pyrido[1,2-a]quinoxalines and pyrido[1,2-a]pyrazines were easily synthesized by the pyrolysis of the aconitate derivatives V and VI, respectively.
