Aza[15]annulenes (4), (8), (10) were prepared via the thermolysis of the vinyl monoazido (1) and vinyl diazide (5).

The tautomerization of (3) into (4) could be monitored by ^1H n.m.r. spectroscopy (in δ_8 -toluene at 75°).

Scheme 1

The thermolysis of vinyl diazide (5) led to (7), as an isolable reaction intermediate, from which 3-methoxy aza[15]annulene (10), 3-keto aza[15]annulene (8), and aza[15]annulene (4) were derived (Scheme 2).

Scheme 2

As expected, aza[15]annulenes (4) and (10) were proved to be strongly paratropic (16K), exhibiting NH proton at very low field, and outer olefinic protons at high field.
