Abstract — Two new thiazolyl betaines 1 and 2, isomers of ergothioneine, have been synthesized as model compounds of a novel betaine isolated from a toxic mushroom.

In the course of our studies¹⁾ on the chemical constituents of poisonous mushroom, Clitocybe acromelalga, a small amount (~1 mg) of a new, amorphous betaine²⁾ ($M^+ 229.0880$, $C_9H_{15}N_3O_2S$) isomeric with ergothioneine was isolated. The spectral properties of the new betaine were similar to those of ergothioneine, but behavior in paper electrophoresis of the former was clearly different from the latter. Therefore, synthesis of the following two 2-aminothiazolyl analogs (1 and 2) of ergothioneine was undertaken in order to compare their properties to those of the newly isolated compound from the mushroom. Although the synthetic compounds were found not identical with the natural product, we report herein the synthesis of 1 and 2, since they may be active as antagonists of ergothioneine³⁾. Moreover some 2-aminothiazole derivatives are shown to act as thyroid inhibitor⁴⁾.

Acid chloride⁵⁾ of α -methyl phthaloyl-L-glutamate was reduced to an aldehyde 3 [NMR: δ (CDCl₃) 2.4–2.7 (4H, m, -CH₂CH₂-), 3.74 (3H, s, -CO₂CH₃), 4.7–5.0 (1H, m, α -proton), 7.6–8.0 (4H, m, -NPh), 9.70 (1H, s, -CHO), MS: m/e 275.0791 (M⁺), calcd. for C₁₄H₁₃NO₅ 275.0880, [α]_D^{25°} -25.1° (C=1.17, CHCl₃)] by (f₃P)₂CuBH₄⁶⁾ (62% yield, 2 eq. f₃P, 1 eq. (f₃P)₂CuBH₄ in acetone, rt. 1.5 hr). Thus obtained aldehyde 3 was converted by phenyltrimethylammonium perbromide in THF (rt. 1.5 hr) to α -bromoaldehyde, which was condensed without purification with thiourea in THF (reflux, 16 hr) to give a 2-aminothiazole derivative 4. [NMR: δ (CDCl₃) 3.5–3.8 (2H, m, -CH₂-),

3.76 (3H, s, $-\text{CO}_2\text{CH}_3$), 5.0—5.2 (1H, m, α -proton), 6.68 (1H, s, thiazole 4-H), 7.6—8.0 (4H, m, -NPh), MS: m/e 332.0661 $[(M+1)^+]$, calcd. for $\text{C}_{15}\text{H}_{14}\text{N}_3\text{O}_4\text{S}$ 332.0703] in 71% yield. After blocking of the aromatic amino group by carbobenzoxy group in the usual manner (88% yield) to give 5 [NMR: δ (CDCl_3) 3.64 (2H, d, $J=8.5$ Hz, $-\text{CH}_2-$), 3.76 (3H, s, $-\text{CO}_2\text{CH}_3$), 5.02 (1H, t, $J=8.5$ Hz, α -proton), 5.16 (2H, s, $-\text{OCH}_2\phi$), 6.83 (1H, s, thiazole 4-H), 7.34 (5H, s, $-\text{OCH}_2\phi$), 7.6—8.0 (4H, m, -NPh), MS: m/e 465.0994 (M^+), calcd. for $\text{C}_{23}\text{H}_{14}\text{N}_3\text{O}_6\text{S}$ 465.0994, mp. 161—162°, $[\alpha]_D^{25}$ -65.3° ($C=0.92$, CHCl_3)], the phthaloyl group was removed by heating 5 with hydrazine acetate (10 eq., 55°C, 16 hr, in MeOH-THF, 77% yield) to afford 6 [NMR: δ (CDCl_3) 3.9—4.1 (2H, m, $-\text{CH}_2-$), 3.70 (3H, s, $-\text{CO}_2\text{CH}_3$), 3.5—3.9 (1H, m, α -proton), 5.23 (2H, s, $-\text{OCH}_2\phi$), 6.90 (1H, s, thiazole 4-H),

7.36 (5H, s, $-\text{OCH}_2\phi$), MS: m/e 335.0872 (M^+), calcd. for $C_{15}H_{17}N_3O_4S$ 335.0938, mp. 123°].

Quaternary methiodide **7** [NMR: δ (CD_3OD) 3.2–3.5 (11H, bs, $-\text{N}^+(\text{CH}_3)_3$ and $-\text{CH}_2-$), 3.76 (3H, s, $-\text{CO}_2\text{CH}_3$), 4.54 (1H, dd, $J=7, 12$ Hz, α -proton) 5.28 (2H, s, $-\text{OCH}_2\phi$), 7.25 (1H, s, thiazole 4-H), 7.40 (5H, s, $-\text{OCH}_2\phi$), $C_{18}H_{24}N_3O_4SI^7$], mp. 195° (dec.)] was obtained through a) dimethylation (37% $\text{HCHO}/\text{NaBH}_3\text{CN}$, rt, 2 hr, in CH_3CN) and b) subsequent quaternarization⁸⁾ ($\text{CH}_3\text{I}/\text{MeOH}$, rt, 16 hr, 70% overall yield). Removal of the protective groups (62% yield, a. $\text{CF}_3\text{CO}_2\text{H}$, reflux, 1.5 hr,

b. $\text{Et}_3\text{N}-\text{H}_2\text{O}-\text{MeOH}$ (1:4:6), 60°C , 16 hr) completed the synthesis of **2** [NMR: δ (D_2O) 3.2–3.4 (11H, bs, $-\text{N}^+(\text{CH}_3)_3$ and $-\text{CH}_2-$), 3.85 (1H, dd, $J=5, 11$ Hz, α -proton), 7.00 (1H, s, thiazole 4-H), MS: m/e 229.0880, calcd. for $C_9H_{15}N_3O_2S$ 229.0885, mp. 210° (dec.), $[\alpha]_D^{25^\circ} -2.7^\circ$ ($C=0.6$, H_2O)].

Synthesis of the other isomer **3** was started from condensation of **8**¹⁰⁾ with thiourea (63% yield, THF, reflux, 1.5 hr) to give **9** [NMR: δ ($CDCl_3$) 3.41 (2H, d, $J=8$ Hz, $-\text{CH}_2-$), 3.72 (3H, s, $-\text{CO}_2\text{CH}_3$), 5.23 (1H, t, $J=8$ Hz, α -proton), 5.50 (2H, bs, $-\text{NH}_2$), 6.07 (1H, s, thiazole 5-H), 7.5–7.9 (4H, m, $-\text{NPh}$ t), MS: m/e 332.0647 [$(M+1)^+$] calcd. for $C_{15}H_{14}N_3O_4S$ 332.0703, mp. $173-175^\circ$], which afforded, through the same sequence of reactions with **4**→**2**, intermediates **10**, **11**, **12**,¹¹⁾ and the final product **3** [NMR: δ (D_2O) 3.2–3.4 (11H, bs, $-\text{N}^+(\text{CH}_3)_3$ and $-\text{CH}_2-$), 3.95 (1H, dd, $J=5, 10$ Hz, α -proton), 6.45 (1H, s, thiazole 5-H), MS: m/e 229.0876 (M^+) calcd. for $C_9H_{15}N_3O_2S$ 229.0882, amorphous, $[\alpha]_D^{25^\circ} -3.6^\circ$ ($C=0.52$, H_2O)] (48% from **12**).

Biological activities of synthetic betaines are now under investigation.
