The reaction of a type 1-R-3-Q-5-benzalimino-1H-1,2,4-triazoles (1) with aryl-oxyacetyl-chlorides in the presence of triethylamine lead to the formation of 1 type 1,2,4-triazolo(1,5-a)pyrimidinone derivatives, while the analogues b type 2-R-3-Q-benzalimino-2H-1,2,4-triazoles (1) formed in the above reaction 2 type β -lactam derivatives.

In the analogues reaction provided with the mixture of dichloroacetic acid and phosphorous oxychloride derivatives 3 and 4 were formed from derivatives a and b, respectively.

Paper deals with the structure-elucidation of derivatives 1 - 4.
