**Abstract** – Methods for the syntheses of 4-substituted isothiochromenes and 1,1-disubstituted 1,3-dihydrobenzo[*c*]thiophenes have been developed. Thus, treatment of  $\alpha$ -substituted *o*-[(*tert*-butylsulfanyl)methyl]styrenes, derived from  $\alpha$ -substituted *o*-bromostyrenes using an easily operated four-step sequence, with iodine in the presence of sodium hydrogencarbonate gave isothiochromene derivatives. These *tert*-butyl sulfides were treated with concentrated hydrobromic acid to give 1,3-dihydrobenzo[*c*]thiophene derivatives.

## INTRODUCTION

Some compounds with the isothiochromene (1*H*-2-benzothiopyran) structure have been reported to exhibit biological activity.<sup>1</sup> To date, construction of this skeleton has been commonly performed *via* the reaction of isothiochroman-4-one with Grignard reagents followed by dehydration with concentrated sulfuric acid.<sup>2</sup> This method, however, suffers from low yields and limited generality. Therefore, some different methods have recently been reported.<sup>3</sup> On the other hand, previous studies in our laboratory have revealed that  $\alpha$ -substituted 2-lithiostyrenes serve, through reactions with a variety of electrophile followed by cyclizations of the resulting precursors, as versatile intermediates for the preparation of heterocyclic derivatives.<sup>4-8</sup> In the present paper, we wish to describe a convenient synthesis of 4-substituted isothiochromenes (**8**) by iodine-mediated cyclization of  $\alpha$ -substituted *o*-[(*tert*-butylsulfanyl)methyl]styrenes (**5**), derived through formylation of  $\alpha$ -substituted 2-lithiostyrenes. We also report that 1,1-disubstituted 1,3-dihydrobenzo[*c*]thiophenes (**13**) can be prepared by hydrobromic

acid-mediated cyclization of **5**. 1,3-Dihydrobenzo[*c*]thiophene 2,2-dioxide, prepared by oxidation of 1,3-dihydrobenzo[*c*]thiophene, has been used as a precursor for the generation of *o*-quinone dimethides, which has been utilized as useful intermediates for the preparation of polycyclic compounds.<sup>9</sup> The reaction of *o*-xylene dihalides with disodium sulfide has been used to prepare 1,3-dihydrobenzo[*c*]thiophenes,<sup>10</sup> though an efficient method based on the Ga-promoted cycloaddition of alkynyl enynes have recently been reported<sup>11</sup> and we recently have reported a synthesis of 1-aryl-1,3-dihydrobenzo[*c*]thiophenes by acid mediated cyclization of 1-[aryl(methoxy)methyl]-2-[(*tert*-butylsulfanyl)methyl]benzenes.<sup>12</sup> However, few general methods for the preparation of 1,1-disubstituted 1,3-dihydrobenzo[*c*]thiophenes have been reported; Nishio reported the formation of 1,1-dimethyl-1,3-dihydrobenzo[*c*]thiophene by a Lawesson's reagent-mediated cyclization of 1-[(2-hydroxymethyl)phenyl]-1-methylethanol.<sup>13</sup>

## RESULTS AND DISCUSSION

Scheme 1

The synthesis of the precursor sulfides (**5**) was accomplished according to the sequence illustrated in Scheme 1. Thus,  $\alpha$ -substituted 2-bromostyrenes **1**, which were easily prepared from 2-bromobenzaldehydes as described previously,<sup>3b,4-7</sup> were treated with butyllithium in THF at  $-78\text{ }^\circ\text{C}$  and the resulting  $\alpha$ -substituted 2-lithiostyrenes were allowed to react with *N*-formylpiperidine at  $-78$  to  $0\text{ }^\circ\text{C}$  to afford  $\alpha$ -substituted 2-vinylbenzaldehydes (**2**) in generally good yields as compiled in Table 1. Initially, the bromine/lithium exchange between **1** and butyllithium was carried out in diethyl ether at  $0\text{ }^\circ\text{C}$  as described previously.<sup>4-8</sup> However, after reactions with *N*-formylpiperidine only low-to-moderate yields of **2** were obtained. The reduction of **2** with sodium borohydride in methanol at  $0\text{ }^\circ\text{C}$  provided  $\alpha$ -substituted *o*-vinylbenzyl alcohols (**3**) in good to excellent yields. Treatment of these alcohols with thionyl chloride in dichloromethane at  $0\text{ }^\circ\text{C}$  to room temperature in the presence of pyridine produced the corresponding  $\alpha$ -substituted

*o*-vinylbenzyl chlorides (**4**), which were used in the next step without purification after aqueous workup. The resultant crude chlorides were allowed to react with *tert*-butyl mercaptide, generated from *tert*-butyl mercaptan and sodium hydride, in DMF at 0 °C to give  $\alpha$ -substituted *o*-[(*tert*-butylsulfanyl)methyl]styrenes (**5**) in good overall yields from **3**.

<sup>a</sup> Yields of isolated products. <sup>b</sup> Overall yields from **3**.

**Scheme 2**

We hoped that these *tert*-butyl sulfides (**5**) would produce 4-substituted isothiochromenes (**8**) on treatment with iodine. In practice, it was found that compounds (**5**) reacted with three equivalents of iodine in acetonitrile at 0 °C in the presence of three equivalents of sodium hydrogencarbonate to result in the isolation of the corresponding desired products (**8**) as the sole products, as depicted in Scheme 2. The synthetic material (**8a**) gave IR and <sup>1</sup>H NMR data, which were identical to those reported for 4-phenylisothiochromene.<sup>2</sup> As shown in Table 2, the yields of the products (**8**) are generally moderate to good, though the yield of 4-methylisothiochromene (**8f**) was only low. Yields of the products (**8**) decreased somewhat if two equivalent each of iodine and sodium hydrogencarbonate were used. In Scheme 2, the pathway to these products from **5** is also shown. Thus, the iodonium ion intermediate (**6**) is

formed on treatment with iodine. The 6-endo cyclization by the attack of one of the lone pairs of the sulfur atom on the  $\beta$ -position of the styryl moiety of **6** occurs exclusively to produce the benzopyranium ion intermediate (**7**). The subsequent eliminations of hydrogen iodide and *tert*-butyl iodide give rise to **8**. 1-(Iodomethyl)-1,3-dihydrobenzo[*c*]thiophenes (**10**), which might be produced *via* the dihydrobenzo[*c*]thiophenium ion intermediate (**9**), generated by the attack of the sulfur atom lone pair on the benzylic carbon of the iodonium ion intermediate (**6**) were not detected at all. Unfavorableness of this pathway may be ascribed to the steric crowd at the reaction center.

**Table 2.** Preparation of isothiochromenes (**8**) and 1,3-dihydrobenzo[*c*]thiophenes (**13**)

<sup>a</sup> Yields of isolated products.

We also found that when *tert*-butyl sulfides (**5**) were treated with concentrated hydrobromic acid in acetonitrile at 0 °C or rt, 1,1-disubstituted 1,3-dihydrobenzo[*c*]thiophenes (**13**) were obtained, as illustrated in Scheme 3. As compiled in Table 2 as well, the yields of the products were generally good, while those of the products carrying an electron-withdrawing chloro substituent on each of the benzene rings were only moderate (Entries 3 and 7). The precursors (**5**) carrying a methoxy group at 4-position on each of the benzene rings (**5d**) and (**5i**) found to be more reactive than the others; therefore, the reaction of these precursors with hydrobromic acid can be conducted at 0 °C. Scheme 3 also shows the pathway to the products (**13**). The Markovnikov addition of a proton to the vinyl moiety of **5** generates the benzyl cation intermediate (**11**), which intramolecularly cyclizes by the attack of the sulfur lone pair on the cation center to produce the dihydrobenzo[*c*]thiophenium ion intermediate (**12**). A loss of *tert*-butyl bromide from this intermediate affords **13**. The use of catalytic amounts of the acid resulted in recovery of considerable amounts of the starting materials.

Scheme 3

In summary, the results reported above demonstrate that 4-substituted isothiochromene and 1,1-disubstituted 1,3-dihydrobenzo[*c*]thiophene derivatives, which are hard to prepare by previous methods, can be tunably prepared from readily available starting materials. Work on further applications utilizing *o*-functionalized (*tert*-butylsulfanyl)alkylbenzenes for the preparation of related heterocycles is now in progress in our laboratory. Results of those efforts will be described in due course.

## EXPERIMENTAL

All melting points were obtained on a Laboratory Devices MEL-TEMP II melting apparatus and are uncorrected. IR spectra were recorded with a Perkin–Elmer Spectrum 65 FTIR spectrophotometer. <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded in CDCl<sub>3</sub> using TMS as an internal reference with a JEOL ECP500 FT NMR spectrometer operating at 500 and 125 MHz, respectively. High-resolution MS spectra were measured by a JEOL JMS-T100GCV (EI or FI, TOF; 70 eV or 2100 V, respectively) or a Thermo Scientific Exactive (ESI, positive) spectrometer. Elemental analyses were performed with an Elementar Vario EL II instrument. TLC was carried out on Merck Kieselgel 60 PF<sub>254</sub>. Column chromatography was performed using WAKO GEL C-200E. All of the organic solvents used in this study were dried over appropriate drying agents and distilled prior to use.

**Starting Materials.** (2-Bromo-5-chlorophenyl)(phenyl)methanone,<sup>14</sup> (2-bromophenyl)(naphthalen-1-yl)methanone,<sup>15</sup> 2-(1-arylethenyl)-1-bromobenzenes **1a**,<sup>4</sup> **1b**,<sup>5</sup> **1c**,<sup>3b</sup> **1d**,<sup>6</sup> **1f**,<sup>4</sup> **1h**,<sup>5</sup> and **1i**<sup>7</sup> were prepared according to the previously reported method. Butyllithium was supplied by Asia Lithium Corporation. All other chemicals used in this study were commercially available.

**1-[1-(2-Bromophenyl)ethenyl]naphthalene (1e).** This compound was prepared in 94% yield from (2-bromophenyl)(naphthalen-1-yl)methanone as described for the preparation of **1a**.<sup>4</sup> A pale-yellow oil; *R*<sub>f</sub> 0.64 (CH<sub>2</sub>Cl<sub>2</sub>/hexane 1:10); IR (neat) 1612 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 5.73 (d, *J* = 1.1 Hz, 1H), 5.82 (d, *J* = 1.1 Hz, 1H), 7.13 (td, *J* = 6.9, 1.7 Hz, 1H), 7.24–7.34 (m, 3H), 7.36–7.50 (m, 3H), 7.58 (d, *J* = 8.0 Hz, 1H), 7.78 (d, *J* = 8.0 Hz, 1H), 7.84 (dd, *J* = 9.2, 2.9 Hz, 1H), 8.23 (dd, *J* = 9.2, 2.3 Hz, 1H), <sup>13</sup>C NMR δ 122.09, 122.53, 125.06, 125.61, 125.96, 126.18, 126.70, 127.21, 127.97, 128.34, 128.75, 131.29, 131.41, 133.51, 134.00, 139.38, 143.43, 147.12. HR-MS (EI). Calcd for C<sub>18</sub>H<sub>13</sub>Br (M): 308.0201. Found: *m/z* 308.0190.

**1-Bromo-4-chloro-2-(1-phenylethenyl)benzene (1g).** This compound was prepared in 68% yield from (2-bromo-5-chlorophenyl)(phenyl)methanone as described for the preparation of **1a**.<sup>4</sup> A colorless oil; *R*<sub>f</sub>

0.64 (CH<sub>2</sub>Cl<sub>2</sub>/hexane 1:10); IR (neat) 1616 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 5.27 (s, 1H), 5.85 (s, 1H), 7.19 (dd, *J* = 7.4, 1.1 Hz, 1H), 7.25–7.33 (m, 6H), 7.51 (d, *J* = 8.6 Hz, 1H); <sup>13</sup>C NMR δ 116.67, 121.26, 126.48, 127.98, 128.43, 129.04, 131.34, 133.27, 134.02, 138.86, 144.19, 147.91. HR-MS (EI). Calcd for  $\text{C}_{17}\text{H}_{16}\text{O}_3$  (M): 268.1099. Found:  $m/z$  268.1099.

**Typical Procedure for the Preparation of 2-(1-Arylethenyl)benzyl Alcohols (3).** [2-(1-Phenylethenyl)phenyl]methanol (**3a**). To a stirring solution of **2a** (0.66 g, 3.2 mmol) in MeOH (6 mL) at 0 °C was added  $\text{NaBH}_4$  (0.12 g, 3.2 mmol) in several portions. After 5 min, 1% aqueous HCl (v/v) (20 mL) was added and the organic solvent was removed by evaporation. The mixture was extracted with AcOEt (3  $\times$  15 mL), and the combined extracts were washed with brine (20 mL), dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated by evaporation. The residue was purified by column chromatography on  $\text{SiO}_2$  ( $\text{Et}_2\text{O}$ /hexane 1:1) to give **3a** (0.55 g, 82%); a pale-yellow oil;  $R_f$  0.35. The spectral data (IR and  $^1\text{H}$  NMR) were identical to those reported previously.<sup>20</sup>

**{2-[1-(4-Methylphenyl)ethenyl]phenyl}methanol (3b):** a colorless oil;  $R_f$  0.28 (AcOEt/hexane 1:5); IR (neat) 3351, 1610  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR  $\delta$  1.59 (br s, 1H), 2.33 (s, 3H), 4.43 (s, 2H), 5.19 (s, 1H), 5.75 (s, 1H), 7.10 (d,  $J = 8.0$  Hz, 2H), 7.16 (d,  $J = 8.0$  Hz, 2H), 7.25 (d,  $J = 7.4$  Hz, 1H), 7.32 (t,  $J = 7.4$  Hz, 1H), 7.37 (t,  $J = 7.4$  Hz, 1H), 7.48 (d,  $J = 7.4$  Hz, 1H);  $^{13}\text{C}$  NMR  $\delta$  21.11, 63.23, 114.68, 126.42, 127.55, 127.94, 128.11, 129.21, 130.16, 137.80, 137.90, 138.65, 140.71, 148.13. HR-MS (EI). Calcd for  $\text{C}_{16}\text{H}_{16}\text{O}$  (M): 224.1201. Found:  $m/z$  224.1195.

**{2-[1-(4-Chlorophenyl)ethenyl]phenyl}methanol (3c):** a colorless oil;  $R_f$  0.24 (AcOEt/hexane 1:5); IR (neat) 3334, 1615  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR  $\delta$  1.54 (br s, 1H), 4.43 (s, 2H), 5.26 (s, 1H), 5.78 (s, 1H), 7.19–7.23 (m, 3H), 7.26 (d,  $J = 8.6$  Hz, 2H), 7.33 (t,  $J = 7.4$  Hz, 1H), 7.39 (t,  $J = 7.4$  Hz, 1H), 7.50 (d,  $J = 7.4$  Hz, 1H);

**Typical Procedure for the Preparation of *tert*-Butyl Sulfides (5).** **1-[(1,1-Dimethylethyl)sulfanyl]methyl-2-(1-phenylethenyl)benzene (5a).** To a stirred solution of **3a** (0.55 g, 2.6 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (8 mL) containing pyridine (0.21 g, 2.6 mmol) at 0 °C was added SOCl<sub>2</sub> (0.31 g, 2.6 mmol) dropwise and temperature was raised to rt. After 4 h, the mixture was diluted by adding CH<sub>2</sub>Cl<sub>2</sub> (20 mL) and treated with H<sub>2</sub>O (20 mL). The layers were separated and the aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 × 15 mL). The combined organic layers were washed with brine (15 mL), dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated by evaporation. The crude product **4a** (0.46 g) was used in the next reaction without purification. Thus, to a stirred suspension of NaH (60% in mineral oil; 88 mg, 2.2 mmol) in DMF (3 mL) at 0 °C was added *t*-BuSH (0.20 g, 2.2 mmol) dropwise. After evolution of H<sub>2</sub> gas had ceased, a DMF (2 mL) solution of the above **4a** was added. After 5 min, saturated aqueous NH<sub>4</sub>Cl (20 mL) was added and the mixture was extracted with AcOEt (3 × 15 mL). The combined extracts were washed with brine (20 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated by evaporation. The residue was purified by column chromatography on SiO<sub>2</sub> (CH<sub>2</sub>Cl<sub>2</sub>/hexane 1:3) to give **5a** (0.47 g, 64%); a white solid; mp 80–81 °C (hexane); IR (KBr) 1615 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 1.21 (s, 9H), 3.55 (s, 2H), 5.33 (s, 1H), 5.82 (d, *J* = 1.4 Hz, 1H), 7.18 (d, *J* = 7.8 Hz, 1H), 7.22 (dd, *J* = 7.8, 7.3 Hz, 1H), 7.25–7.31 (m, 6H), 7.47 (d, *J* = 7.8 Hz, 1H); <sup>13</sup>C NMR δ 30.64, 30.68, 42.75, 115.78, 126.61, 126.71, 127.69, 127.74, 128.32, 130.07, 130.36, 136.14, 140.74, 141.32, 148.04. **Typical Procedure for the Preparation of 1H-2-Benzothiopyrans (8). 4-Phenyl-1H-2-benzothiopyran (8a).<sup>2</sup>** To a stirred solution of **5a** (0.24 g, 0.85 mmol) in MeCN (5 mL) containing  $NaHCO_3$  (0.21 g, 2.6 mmol) at 0 °C was added  $I_2$  (0.65 g, 2.6 mmol) in portions. The temperature was

raised to rt, and the mixture was stirred for 15 min before 10% aqueous  $\text{Na}_2\text{S}_2\text{O}_3$  (15 mL) was added. After evaporation of MeCN, the organic materials were extracted with AcOEt ( $3 \times 15$  mL), and the combined extracts were washed with saturated aqueous  $\text{NaHCO}_3$  and brine (20 mL each), and dried over anhydrous  $\text{K}_2\text{CO}_3$ . Evaporation of the solvent gave a residue, which was purified by column chromatography on  $\text{SiO}_2$  to afford **8a** (0.12 g, 67%); a pale-yellow oil;  $R_f$  0.45 ( $\text{CH}_2\text{Cl}_2/\text{hexane}$  1:4). The spectral data (IR and  $^1\text{H}$  NMR) were identical to those reported previously.<sup>2</sup>

**1-(4-Methoxyphenyl)-1-methyl-1,3-dihydrobenzo[*c*]thiophene (13d):** a pale-yellow oil; *R<sub>f</sub>* 0.34 (CH<sub>2</sub>Cl<sub>2</sub>/hexane 3:10); IR (neat) 1608, 1581, 1508 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 2.08 (s, 3H), 3.77 (s, 3H), 4.30 (s, 2H), 6.80 (d, *J* = 8.6 Hz, 2H), 6.96 (dd, *J* = 8.6, 1.1 Hz, 1H), 7.20–7.23 (m, 2H), 7.25–7.29 (m, 3H); <sup>13</sup>C NMR δ 31.05, 36.43, 55.21, 63.12, 113.30, 124.31, 124.68, 126.82, 127.04, 128.02, 139.80, 140.31, 149.47, 158.10. HR-MS (EI). Calcd for C<sub>16</sub>H<sub>16</sub>OS (M): 256.0922. Found: *m/z* 256.0932.

**1-Methyl-1-(naphthalen-1-yl)-1,3-dihydrobenzo[*c*]thiophene (13e):** a pale-yellow solid; mp 119–120 °C (hexane/CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 1598, 1510, 1482, 1455 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 2.27 (s, 3H), 4.38 (d, *J* = 14.3 Hz, 1H), 4.47 (d, *J* = 14.3 Hz, 1H), 6.88 (d, *J* = 7.4 Hz, 1H), 7.15 (t, *J* = 7.4 Hz, 1H), 7.24–7.48 (m, 6H), 7.76 (d, *J* = 8.0 Hz, 1H), 7.81 (d, *J* = 8.0 Hz, 1H), 8.01 (d, *J* = 8.6 Hz, 1H); <sup>13</sup>C NMR δ 33.93, 36.81, 63.22, 124.33, 124.49, 124.67, 125.03 (2 overlapped Cs), 125.27, 126.95, 127.10, 127.26, 129.02, 129.09, 130.85, 135.16, 139.52, 140.54, 150.10. HR-MS (EI). Calcd for C<sub>19</sub>H<sub>16</sub>S (M): 276.0973. Found: *m/z* 276.0966. Anal. Calcd for C<sub>19</sub>H<sub>16</sub>S: C, 82.57; H, 5.84. Found: C, 82.33; H, 5.81.

**1-Methyl-1-phenyl-1,3-dihydrobenzo[*c*]thiophene (13f):** a colorless liquid; *R<sub>f</sub>* 0.32 (hexane). The <sup>1</sup>H and <sup>13</sup>C NMR data for this compound were identical to those reported previously.<sup>14</sup>

**6-Chloro-1-methyl-1-phenyl-1,3-dihydrobenzo[*c*]thiophene (13g):** a pale-yellow oil; *R<sub>f</sub>* 0.59 (Et<sub>2</sub>O/hexane 1:20); IR (neat) 1592, 1481 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 2.09 (s, 3H), 4.26 (s, 2H), 6.94 (s, 1H), 7.21–7.23 (m, 3H), 7.29–7.34 (m, 4H); <sup>13</sup>C NMR δ 30.64, 35.98, 63.12, 124.57, 125.68, 126.73, 126.89, 127.15, 128.21, 133.00, 139.01, 146.80, 151.26. HR-MS (EI). Calcd for C<sub>15</sub>H<sub>13</sub>ClS (M): 260.0427. Found: *m/z* 260.0435. Anal. Calcd for C<sub>15</sub>H<sub>13</sub>ClS: C, 69.09; H, 5.02. Found: C, 68.90; H, 5.24.

**5-Methoxy-1-methyl-1-phenyl-1,3-dihydrobenzo[*c*]thiophene (13h):** a pale-yellow oil; *R<sub>f</sub>* 0.48 (AcOEt/hexane 1:10); IR (neat) 1607, 1580, 1494, 1443 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 2.10 (s, 3H), 3.73 (s, 3H), 4.21 (d, *J* = 13.2 Hz, 1H), 4.25 (d, *J* = 13.2 Hz, 1H), 6.49 (d, *J* = 2.3 Hz, 1H), 6.80 (dd, *J* = 8.6, 2.3 Hz, 1H), 7.18 (d, *J* = 8.6 Hz, 1H), 7.19 (t, *J* = 7.4 Hz, 1H), 7.27 (dd, *J* = 8.0, 7.4 Hz, 2H), 7.34 (d, *J* = 8.0 Hz, 2H); <sup>13</sup>C NMR δ 30.63, 35.84, 55.44, 63.26, 109.61, 112.93, 125.13, 126.59, 126.68, 128.08, 132.53, 147.56, 150.64, 159.09. HR-MS (EI). Calcd for C<sub>16</sub>H<sub>16</sub>OS (M): 256.0922. Found: *m/z* 256.0921. Anal. Calcd for C<sub>16</sub>H<sub>16</sub>OS: C, 74.96; H, 6.29. Found: C, 74.80; H, 6.24.

**5,6-Dimethoxy-1-methyl-1-phenyl-1,3-dihydrobenzo[*c*]thiophene (13i):** a white solid; mp 69–70 °C (hexane/ CH<sub>2</sub>Cl<sub>2</sub>); IR (KBr) 1603,1505 cm<sup>-1</sup>; <sup>1</sup>H NMR δ 2.11 (s, 3H), 3.76 (s, 3H), 3.89 (s, 3H), 4.24 (d, *J* = 15.5 Hz, 1H), 4.26 (d, *J* = 15.5 Hz, 1H), 6.44 (s, 1H), 6.77 (s, 1H), 7.20 (td, *J* = 7.4, 1.1 Hz, 1H), 7.27 (t, *J* = 7.4 Hz, 2H), 7.32 (dd, *J* = 7.4, 1.1 Hz, 2H); <sup>13</sup>C NMR δ 30.82, 36.55, 55.98, 56.03, 63.46, 106.92, 107.02, 126.50, 126.52, 128.11, 132.10, 140.76, 148.04, 148.42, 148.56. HR-MS (FI). Calcd for C<sub>17</sub>H<sub>18</sub>O<sub>2</sub>S (M): 286.1028. Found: *m/z* 286.1034. Anal. Calcd for C<sub>17</sub>H<sub>18</sub>O<sub>2</sub>S: C, 71.30; H, 6.34. Found: C, 70.95; H, 6.22.

## ACKNOWLEDGEMENTS

We wish to thank Mrs. Miyuki Tanmatsu of this university for recording mass spectra and performing combustion analyses.
