Abstract – Facile reaction sequences for the preparation of 5,6-disubstituted thieno[2,3-*d*]pyrimidines starting with 4-chloropyrimidines have been developed. 4-Chloro-6-methoxypyrimidines were aroylated at the 5-positions *via* lithiation with LDA and subsequent treatment with benzaldehyde or *N*-methoxy-*N*-methylbenzamides to give aryl(4-chloro-6-methoxypyrimidin-5-yl)methanones. These pyrimidinyl ketones were transformed in one-pot into 5,6-disubstituted 4-methoxythieno[2,3-*d*]pyrimidines by a successive treatment with sodium sulfide, $BrCH_2EWGs$, and sodium hydride. Lithiation of 4,6-dichloro-2-(methylsulfanyl)pyrimidine at the 5-position was followed by treatment with tertiary formamides to give 4-chloro-6-(dialkylamino)pyrimidine-5-carboxaldehydes, which could be transformed into 5,6-disubstituted 4-(dialkylamino)thieno[2,3-*d*]pyrimidines *via* aryl[4-chloro-6-(dialkylamino)-pyrimidin-5-yl]methanones using the same one-pot thiophene ring forming sequence.

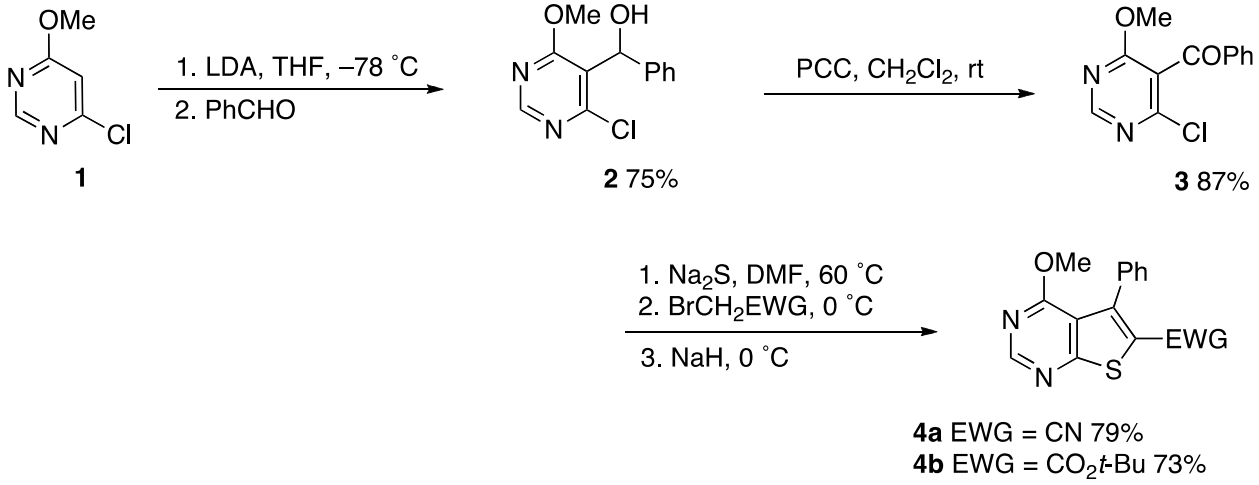
INTRODUCTION

We have previously reported that 2,3-disubstituted thieno[2,3-*b*]pyridines,[1] thieno[2,3-*c*]pyridines,[1] thieno[3,2-*c*]pyridines,[1] and 6,7-disubstituted thieno[2,3-*b*]pyrazines[2] can be prepared in one-pot from corresponding aryl(chloropyridinyl)methanones and aryl(2-chloropyrazin-3-yl)methanones by successive treatment with sodium sulfide, $BrCH_2EWGs$, and sodium hydride. As an extension of these syntheses to other thiophene-fused nitrogen heterocycles, we decided to synthesize 5,6-disubstituted

thieno[2,3-*d*]pyrimidines. We now report the results of our investigation, which provide convenient routes to 4-methoxy- (**4** and **7)** and 4-(dialkylamino)thieno[2,3-*d*]pyrimidines (**12**) starting with 4-chloropyrimidines. Thieno[2,3-*d*]pyrimidines have attracted significant interest from chemical community because of their medicinal and synthetic utilities. A number of compounds having the thieno[2,3-*d*]pyrimidine structure have been reported to show biological activities.[3,4] Thieno[2,3-*d*]pyrimidine derivatives have been utilized for the preparation of structurally more complex and biologically more useful heterocycles.[5] Hitherto many groups have reported efficient methods for the preparation of thieno[2,3-*d*]pyrimidines derivatives.[4,6] However, most of these methods depend on the pyrimidines ring formation starting with appropriately substituted thiophene derivatives.

RESULTS AND DISCUSSION

First, we tried direct 5-benzoylation of 4-chloro-6-methoxypyrimidine (**1**) providing (4-chloro-6-methoxypyrimidin-5-yl)phenylmethanone (**3**) in order to prepare 4-methoxy-5-phenylthieno[2,3-*d*]pyrimidines (**4**). Treatment of **1** with LDA in THF at –78 ˚C was followed by the addition of *N*-methoxy-*N*-methylbenzamide. However, this attempt resulted in failure; no benzoylation occurred. Compound **3** proved to be obtainable by the following two-step sequence. After treatment of **1** with LDA under the above conditions, benzaldehyde was added to give upon aqueous workup (4-chloro-6-methoxypyrimidin-5-yl)phenylmethanol (**2**) in good yield. The PCC oxidation of **2** led to rapid and good yield conversion into **3**, as shown in Scheme 1. The previously reported one-pot thiophene ring formation was applied to this chloropyrimidinyl ketone (**3**). Thus, **3** was allowed to react with sodium sulfide in DMF at 60 ˚C to form reddish brown solutions within 1 h, which were successively treated with $BrCH_2EWG$s and sodium hydride at 0 ˚C to afford, after aqueous workup followed by recrystallization, 6-substituted 4-methoxy-5-phenylthieno[2,3-*d*]pyrimidines (**4a**) and (**4b**) in good yields.



Scheme 1

Subsequently, it was found that 4-chloro-6-methoxy-2-(methylsulfanyl)pyrimidine (**5**) performed more capably than **1** to permit direct formation of aryl[4-chloro-6-methoxy-2-(methylsulfanyl)pyrimidin-5-yl]methanones (**6**) as shown in Scheme 2. Thus, treatment of **5** with LDA in THF at –78 ˚C followed by the addition of *N*-methoxy-*N*-methylbenzamides afforded **6** after aqueous workup in fair yields as summarized in Table 1. When the ketones (**6**) thus obtained were treated successfully with sodium sulfide, $BrCH_2EWGs$, and sodium hydride under the same conditions as described for the preparation of **4**, 5,6-disubstituted 4-methoxy-2-(methylsulfanyl)thieno[2,3-*d*]pyrimidines (**7**) were obtained in the yields summarized in Table 2. The yields ranged from moderate to fair depending on the substrates (**6**).

In order to extend the present method to the synthesis of 5,6-disubstituted 4-(dialkylamino)thieno[2,3-*d*]pyrimidines (**12**), we initially attempted 5-benzoylation of 4-chloro-6-dimethylamino-2-(methylsulfanyl)pyrimidine under the same conditions as described for the preparation of **6**. Unfortunately, however, this attempt resulted in failure; only a trace amount of the desired product was obtained. Of interest is that when 4,6-dichloro-2-(methylsulfanyl)pyrimidine (**8**) was lithiated with

LDA in THF at –78 ˚C and the resulting lithium product was treated with tertiary formamides, 4-chloro-6-dialkylamino-2-(methylsulfanyl)pyrimidine-5-carboxaldehydes (**9**) were obtained in fair to good yields as shown in Scheme 3. Unfortunately, however, simultaneous 5-benzoylation and 4-dimethylamination could not be accomplished using *N,N*-dimethylbenzamide; the reaction gave an intractable mixture of products. The action of arylmagnesium bromide on these aldehydes (**9),** followed by PCC oxidation of the resulting alcohols (**10**), gave aryl(4-chloropyrimidin-5-yl)methanones (**11**) in generally good yields as summarized in Table 3. These ketones (**11**) were subjected to the one-pot sequence under the same reaction conditions described for the preparation of **4** and **7**. It was found that they behaved similarly to give rise to the desired products (**12**) as shown in Scheme 3. The yields of **12** are moderate as summarized in Table 4.

In conclusion, we have demonstrated that 5,6-disubstituted 4-methoxy- and 4-(dialkylamino)thieno[2,3-*d*]pyrimidines could be prepared from 4-chloropyrimidines. The method may be of value in organic synthesis because of the ready availability of the starting materials and the easy experimental operations.

EXPERIMENTAL

All melting points were obtained on a Laboratory Devices MEL-TEMP II melting apparatus and are uncorrected. IR spectra were recorded with a Shimadzu FTIR-8300 spectrophotometer. ^{1}H NMR spectra were recorded in $CDCl_3$ using TMS as an internal reference with a JEOL ECP500 FT NMR spectrometer operating at 500 MHz or a JEOL LA400FT NMR spectrometer operating at 400 MHz. ^{13}C NMR spectra were recorded in $CDCl_3$ using TMS as an internal reference with a JEOL ECP500 FT NMR spectrometer operating at 125 MHz. Low-resolution MS spectra (EI, 70 eV) were measured by a JEOL JMS AX505 HA spectrometer. TLC was carried out on Merck Kieselgel 60 PF_{254}. Column chromatography was performed using WAKO GEL C-200E. All of the organic solvents used in this study were dried over appropriate drying agents and distilled prior to use.

Starting Materials. 4-Chloro-6-methoxypyrimidine (**1**) was prepared according to the reported method.[7] *n*-BuLi was supplied by Asia Lithium Corporation. All other chemicals used in this study were commercially available.

(4-Chloro-6-methoxypyrimidin-5-yl)phenylmethanol (2). To a stirred solution of LDA (1.8 mmol), generated by the standard method from *n*-BuLi and *i*-Pr_2NH, in THF (2 mL) at –78 ˚C was added a solution of **1** (0.25 g, 1.8 mmol) in THF (2 mL) dropwise. After 1.5 h, PhCHO (0.19 mg, 1.8 mmol) was added and stirring was continued for an additional 30 min. Saturated aqueous NH_4Cl (10 mL) was added and the mixture was extracted with AcOEt (3 × 10 mL). The combined extracts were washed with brine, dried over anhydrous Na_2SO_4, and concentrated by evaporation. The residue was purified by column chromatography on silica gel (AcOEt–hexane 1:2) to give **2** (0.33 g, 75%); a white solid; mp 89–91 ˚C (hexane–CH_2Cl_2); IR (KBr) 3310 cm^{-1}; ^{1}H NMR (500 MHz) δ 3.55 (d, *J* = 11.5 Hz, 1H), 4.01 (s, 3H), 6.28 (d, *J* = 11.5 Hz, 1H), 7.28–7.37 (m, 5H), 8.55 (s, 1H). Typical Procedure for the Preparation of Thienopyrimidines (4), (7), and (12). 4-Methoxy-5-phenylthieno[2,3-*d*]pyrimidine-6-carbonitrile (4a). A solution of **3** (0.14 g, 0.56 mmol) and Na_2S nonahydrate (0.15 g, 0.62 mmol) in DMF (3 mL) was heated at 60 ˚C for 1 h. After cooling to 0 ˚C, $BrCH_2CN$ (74 mg, 0.62 mmol) was added; the mixture was stirred for 15 min. Then NaH (60% in oil; 25 mg, 0.62 mmol) was added and stirring was continued for an additional 10 min before water (20 mL) was added. The precipitate was collected by filtration and recrystallized from hexane–CH_2Cl_2 to give **4a** (0.12 g, 79%); a beige solid; mp 189–190 ˚C; IR (KBr) 2220 cm^{-1}; ^1H NMR (500 MHz) δ 3.96 (s, 3H), 7.51 (br s, 5H), 8.77 (s, 1H); ^{13}C NMR δ 54.35, 104.88, 113.74, 116.52, 128.07, 129.47, 129.58, 132.19, 146.55, 156.17, 165.36, 168.93; MS *m/z* 267 (M^+, 100).
